

Bip - Bug #641

/who replies aren't routed to correct client

Description Using bip on freenode, with two hexchat clients, I get regular noise to the channels corresponding to the output of a /who command. This seems to be from hexchat's /away tracking, which periodically sends this command. It appears that bip doesn't know which client to route the response to, so you get this noise. In znc, it seems this is fixed by enabling route_replies, but I can't find such a thing in bip.
