It should have created a group of the same name. I checked an USERGROUPS_ENAB is set to yes on Orthos, so there is a problem somewhere.

I would prefer we find out the source of the problem before deciding on a fix. I'm not opposed to creating the group separately but the current patch does not reproduce the intended behavior since it adds the user in the *users* group which is not something we want. So if we choose to use this patch then we would need to make the new group the primary group. Then we need to fix the current installation on Orthos.

#7 - 2020-07-10 18:04 - Pierre-Louis Bonicoli

- *Status changed from In Progress to Rejected*

- *Branch changed from `ansible-role-httpd_php_fpm@ create_unix_group_for_pool_workers` to `ansible-role-httpd_php_fpm@create_unix_group_for_pool_workers`*

It looks like I tried to move the Generate Zabbix UI configuration before the Install PHP for the vhost (in order to workaround [#706](#)). Since this update has been discarded, this issue can be discarded too :)
